

CONTROL EXPERIENCE CAN HELP WITH PROJECT SUCCESS

With over 20 years of project experience, we understand the nuances of successful projects. We have a proven track record of successfully managed projects from simple dam gate controls to complex control schemes for both plant and governor operations.

Most of the control systems, and especially the governors, are not thoroughly understood and specialized expertise may be needed to ensure the best solution for the task. This service is also available if there is a lack of resources or time. Our services span from simple assistance to full project management. We can help get any size project on the right path.

Project support or consultation can range from the very beginning of a project, including evaluating the existing system for continued maintainability and reliability, through the installation and testing of new equipment. Because Versalence does not provide equipment or parts for projects, we will be an unbiased resource.

Additional tasks could include contractor evaluation to site installation supervision and testing verification and on to project close out, including verifying completion of manuals and as-installed drawings.

VERSALENCE, LLC
Sustainable Energy
